## Problem A. Strange Device

Time limit: $\quad 4$ seconds
Memory limit: $\quad 512$ megabytes
Archaeologists have found a strange device that was probably created by some ancient civilization. The device has a screen that displays two integers: $x$ and $y$.

After exploring the device the scientists have made a conclusion that the device is kind of a clock. It measures time $t$ passed from some moment in the past, but shows it in some weird way, probably used by the creators of the device. If the time passed is an integer $t$, the two integers displayed are: $x=\left(\left(t+\left\lfloor\frac{t}{B}\right\rfloor\right) \bmod A\right)$, and $y=(t \bmod B)$. Here $\lfloor x\rfloor$ is the floor function - the greatest integer less or equal to $x$.

The archaeologists have studied the device and found out that its screen wasn't turned on all the time. Actually it was only working during $n$ continuous periods of time, the $i$-th of them was from the moment $l_{i}$ to the moment $r_{i}$, inclusive. Now the scientists would like to calculate how many distinct pairs $(x, y)$ were shown by the device when its screen was on.

Two pairs $\left(x_{1}, y_{1}\right)$ and $\left(x_{2}, y_{2}\right)$ are distinct if $x_{1} \neq x_{2}$ or $y_{1} \neq y_{2}$.

## Input

The first line contains three integers $n, A$, and $B\left(1 \leq n \leq 10^{6} ; 1 \leq A, B \leq 10^{18}\right)$.
Each of the following $n$ lines contains two integers $l_{i}$ and $r_{i}$, the beginning and the end of the $i$-th segment $\left[l_{i}, r_{i}\right]$ when the device screen was turned on $\left(0 \leq l_{i} \leq r_{i} \leq 10^{18} ; r_{i}<l_{i+1}\right)$.

## Output

Output the number of distinct pairs $(x, y)$ that were shown on the device screen when it was turned on.

## Scoring

Let $S=\sum_{i=1}^{n}\left(r_{i}-l_{i}+1\right)$ and $L=\max _{i=1}^{n}\left(r_{i}-l_{i}+1\right)$.
Subtask 1 (points: 10)
$S \leq 10^{6}$.
Subtask 2 (points: 5)
$n=1$.

## Subtask 3 (points: 5)

$A \cdot B \leq 10^{6}$.

## Subtask 4 (points: 5)

$B=1$.

## Subtask 5 (points: 5)

$B \leq 3$.
Subtask 6 (points: 20)
$B \leq 10^{6}$.

Subtask 7 (points: 20)
$L \leq B$.

## Subtask 8 (points: 30)

No additional constraint.

## Examples

| input | output |
| :---: | :---: |
| $\begin{array}{lll} \hline 3 & 3 & 3 \\ 4 & 4 & \\ 7 & 9 & \\ 17 & 18 \end{array}$ | 4 |
| $\begin{array}{ll} 3 & 5 \\ 1 & 10 \\ 10 & 68 \\ 50 & 98 \end{array}$ | 31 |
| $\begin{array}{lll} 2 & 16 & 13 \\ 2 & 5 & \\ 18 & 18 \end{array}$ | 5 |

## Note

In the first test, the device screen shows the following integers.

| $t$ | $(x, y)$ |
| :---: | :---: |
| 4 | $(2,1)$ |
| 7 | $(0,1)$ |
| 8 | $(1,2)$ |
| 9 | $(0,0)$ |
| 17 | $(1,2)$ |
| 18 | $(0,0)$ |

So there are four distinct pairs $(0,0),(0,1),(1,2),(2,1)$.
